## Question 1

What is generated when you build/deploy a CUBE calculation view design-time file? Note: There are 2 correct answers to this question.

- A. Metadata to enable consumption by external tools
- B. A column view in a container
- C. An SQL execution plan
- D. Cached results to improve read performance

**Answer A B**

## Question 12

How can you define a variable that presents its value help hierarchically? Note: There are 2 correct answers to this question.

- A. Create a level hierarchy and assign it to the variable.
  - Ensure the variable's reference column is the top level of the hierarchy.
- B. Create a parent-child hierarchy and assign it to the variable.
  - Ensure the variable's reference column is the parent attribute of the hierarchy.
- C. Create a parent-child hierarchy and assign it to the variable.
  - Ensure the variable's reference column is the child attribute of the hierarchy.
- D. Create a level hierarchy and assign it to the variable.
  - Ensure the variable's reference column is the leaf level of the hierarchy.

**Answer C D**

## Question 3

Why do you create calculation views of data category DIMENSION with type TIME?

- A. To add a temporal condition to a join to find matching records from two tables based on a date
- B. To provide additional time-related navigation possibilities
- C. To store historical versions of attributes
- D. To provide the time intervals required by time-dependent parent-child hierarchies

**Answer B**

## Question 4

What are some best practices for writing SQLScript for use with calculation views? Note: There are 2 correct answers to this question.

- A. Break up large statements by using variables.
- B. Use dynamic SQL.
- C. Control the flow logic using IF-THEN-ELSE conditions.
- D. Choose declarative language instead of imperative language.

**Answer A D**

## Question 5

Which tool generates and runs the SQL for a specific node of your calculation view?

- A. SQL analyzer
- B. Explain plan
- C. Database explorer
- D. Debug Query mode

**Answer D**
